

THE AEGES AEGYPTI MOSQUITO PROBLEM

Prior to 2013, this mosquito was not in Fresno County.

IT HAS SPREAD THROUGHOUT FRESNO COUNTY COMMUNITIES.

Aedes aegypti usually does not fly more than a quarter mile from its development site.

They have been observed following people into vehicles, where they can be transported to our schools, workplaces, or many miles away.

They will bite repeatedly throughout the day & into the night.

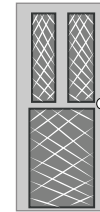

Active Ingredient:

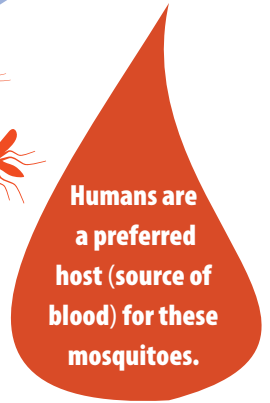

Oil of lemon eucalyptus.....	30%
Other ingredients.....	70%
Total.....	100%

Look for one of these Active Ingredients:

DEET, Picaridin, or Oil of Lemon Eucalyptus.

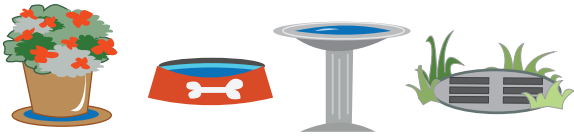

They readily enter through open doors, pet doors, or torn window screens AT EVERY OPPORTUNITY.

According to the CDC, higher percentages of active ingredient provide longer protection.

This mosquito utilizes small containers & yard drainage systems

in residential properties to lay its eggs.

Why is this important?

When water is introduced into these, the eggs will hatch, offspring will develop, & adult mosquitoes will emerge in about a week.

Check these common mosquito development sources in your front and back yards for water.

| <input type="checkbox"/> Outside toys | <input type="checkbox"/> Wheelbarrow |

If water or mosquito development is found: dump, drain or discard.

Pesticides can be used to suppress adult mosquitoes, but control is short lived.

Unless the development sites are eliminated, the next generation of newly hatched mosquitoes will quickly replace those killed with pesticides.
